**Solution Sheet 10, July 25, 2016**

1. Since each  $3 \times 4$  and  $4 \times 3$  rectangle needs to have at least one black square, the minimum possible is 12. This can be achieved with the following configuration.

	X			X			X		
			X						
	X						X		
			X			X			
		X							
	X			X			X		

2. By substituting the two points  $A(-2;1)$  and  $B(2;9)$  into the equation of the parabola,

4. Let  $a$  and  $b$  be the shorter two sides of the triangle and  $c$  be the hypotenuse. Then we have

$$\frac{1}{2}ab = 3(a + b + c):$$

Dividing both sides by 3, using  $c = \sqrt{a^2 + b^2}$  and rearranging

$$\frac{ab}{6} (a + b) = \sqrt{a^2 + b^2}:$$

Squaring both sides,

$$\frac{a^2 b^2}{36} (a + b)^2 = a^2 + b^2:$$

Simplifying,

$$a^2$$

(d)  $x - y = 7$  and  $x^2 + xy + y^2 = 7$

The first and third cases have no solutions, the second case has solutions  $fx = 5; y = 6g; fx = 6; y = 5g$  and fourth case has solutions  $fx = 3; y = 4g; fx = 4; y = 3g$ .

6.

### Senior Questions

1. For  $p = 2$  we have  $2^2 + 2^2 = 8$  which is not prime. For  $p = 3$ , we have  $2^3 + 3^2 = 17$  which is prime. For  $p > 3$  (odd), we claim that  $2^p + p$
